SGLT2'S: Diabetes and Beyond

Bryan Vinik, MD Grand Rounds Boca Raton Regional Hospital September 24th 2019

Global Projections for the Diabetes Epidemic: 2003-2025

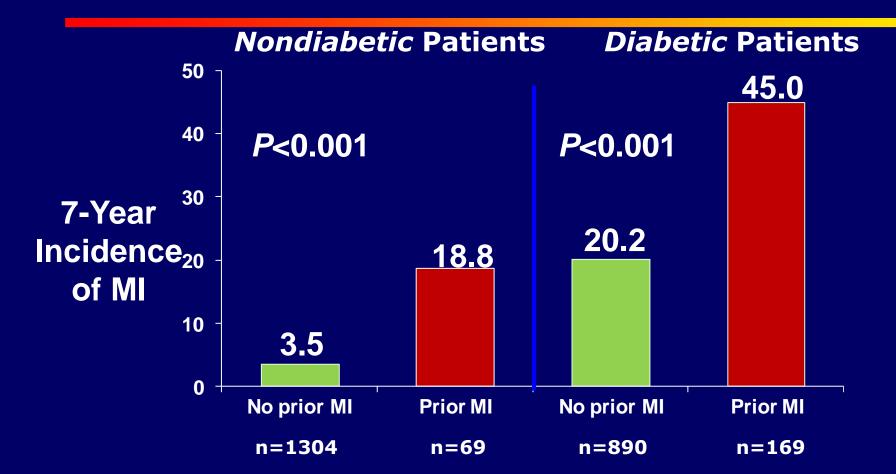

M = million, AFR = Africa, NA = North America, EUR = Europe, SACA = South and Central America, EMME = Eastern Mediterranean and Middle East, SEA = South-East Asia, WP = Western Pacific Diabetes Atlas Committee. *Diabetes Atlas 2nd Edition:* IDF 2003.

In a Single Year in the United States...

- 86,000 amputations are performed because of diabetes
- 12,000-24,000 people lose their eyesight from diabetes
- 41,000 people begin treatment for end-stage kidney disease
- 213,000 people die from diabetes and its complications

American Diabetes Association. National Diabetes Fact Sheet. Available at http://www.diabetes.org/diabetes-statistics. Accessed April 29, 2005.

Diabetes = CVD Risk

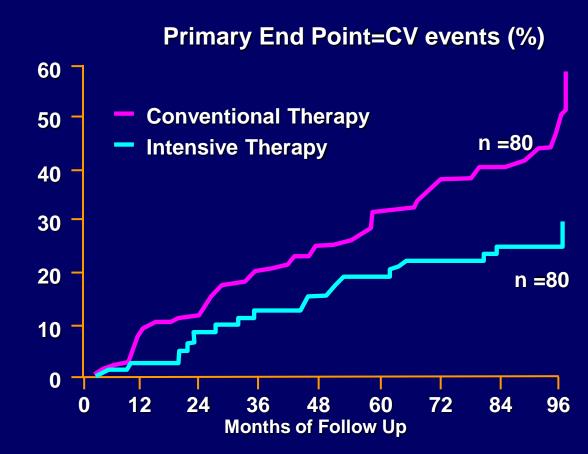

More recent studies suggest that this is perhaps only true for those with fairly long-standing diabetes – duration over ten years.

Haffner SM et al. N Engl J Med. 1998;339:229; Arch Intern Med. 2011;171:404.

Benefit of Comprehensive, Intensive Management: STENO 2 Study

Treatment Goals:

- Intensive TLC
- HgbA1c <6.5%
- Cholesterol <175</p>
- Triglycerides <150</p>
- BP <130/80

Gaede, P. et al, NEJM 2003;348:390-393

Main Results Steno – 2 Study

Complication

Risk ratio (95% CI) p value

1° Endpoint	0.47 (0.24 – 0.73)	0.008	53% risk reduction
Nephropathy	0.39 (0.17 – 0.87)	0.003	61% risk reduction
Retinopathy	0.42 (0.21 – 0.86)	0.02	58% risk reduction
Autonomic neuropathy	0.37 (0.18 – 0.79)	0.002	63% risk reduction
Peripheral neuropathy	1.09 (0.54 – 2.22	0.66	 -

0.2 0.4 0.6 0.8 1.0 1.2 1.4 1.6 1.8

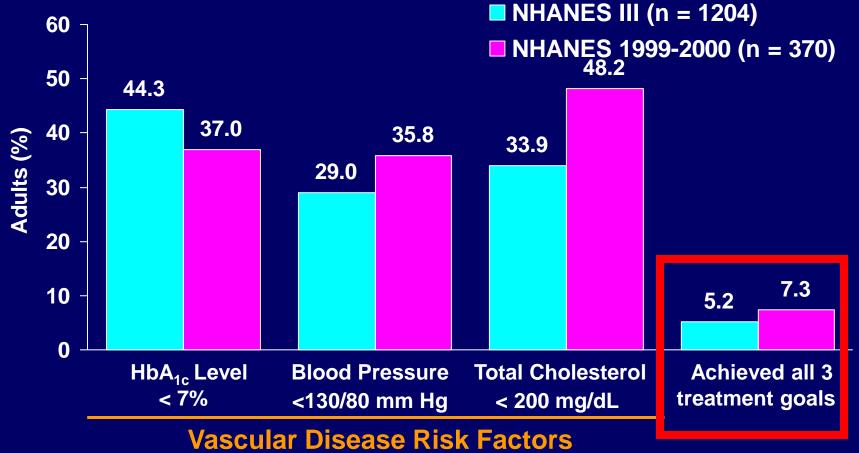

INTENSIVE better **CONVENTIONAL** better

1° endpoint: CVD death, non-fatal MI, CABG, PTCA, non-fatal stroke, amputation, any bypass

Renal Handling of Glucose

Summary of Observed Efficacy of SGLT2 Inhibitors

- Similar to other oral antihyperglycemic agents in A1C reduction
 - Reduces both FPG and PPG
 - Certainly equivalent efficacy to metformin, sulfonylurea and DPP-4 inhibitors
- Modest weight loss
 - ~3 kg at 26 weeks vs placebo; slightly greater weight loss at 52 weeks
- Modest blood pressure reduction
 - 2-7 mm Hg vs placebo
- No intrinsic increased risk of hypoglycemia

Empagliflozin, Cardiovascular Outcomes, and Mortality in Type 2 Diabetes

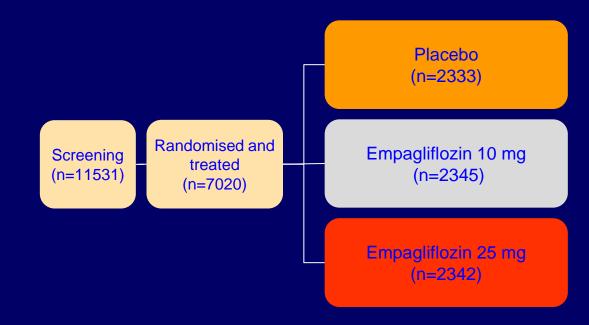

Bernard Zinman, M.D., Christoph Wanner, M.D., John M. Lachin, Sc.D., David Fitchett, M.D., Erich Bluhmki, Ph.D., Stefan Hantel, Ph.D., Michaela Mattheus, Dipl. Biomath., Theresa Devins, Dr.P.H., Odd Erik Johansen, M.D., Ph.D., Hans J. Woerle, M.D., Uli C. Broedl, M.D., and Silvio E. Inzucchi, M.D., for the EMPA-REG OUTCOME Investigators

N Engl J Med 2016; 373:2117-28.

Primary outcome: 3-point MACE = Nonfatal stroke, Nonfatal myocardial infarction, and Cardiovascular death

Zinman B, et al. N Engl J Med. 2015. 373(22):2117-28.

EMPA-REG (empagliflozin) Randomization

Study medication was given in addition to standard of care

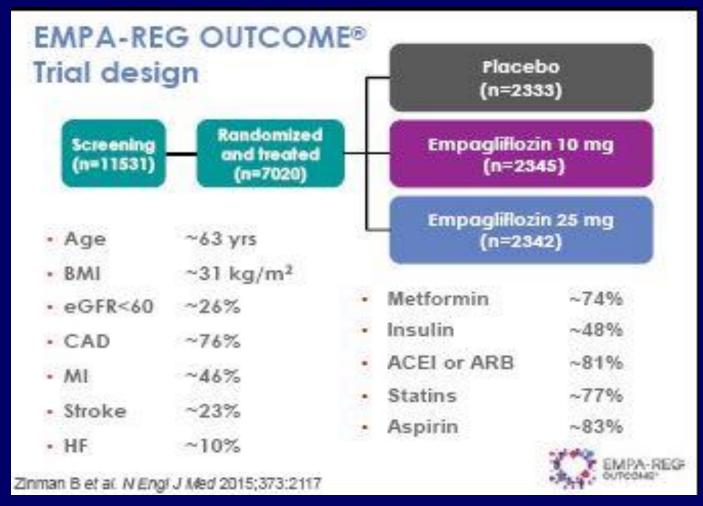

Glucose-lowering therapy was to remain unchanged for first 12 weeks

Treatment assignment double masked

The trial was to continue until at least 691 patients experienced an adjudicated primary outcome event

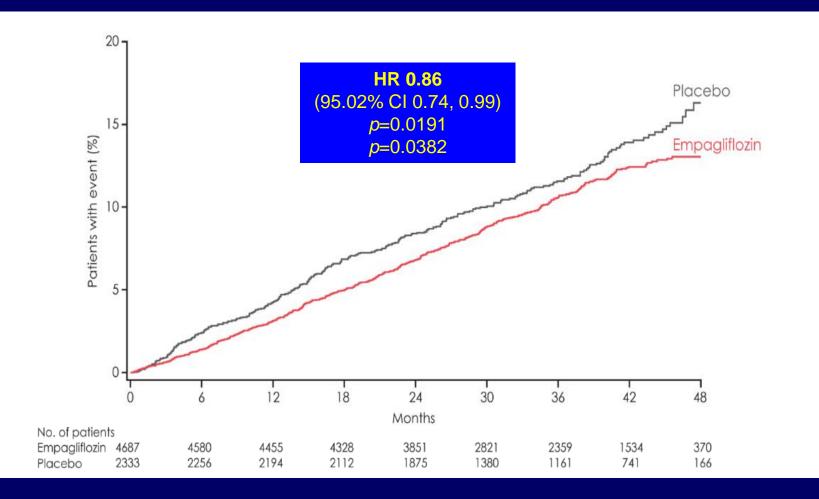

Zinman B, et al. N Engl J Med. 2015. 373(22):2117-28.

EMPA-REG Baseline Demographics

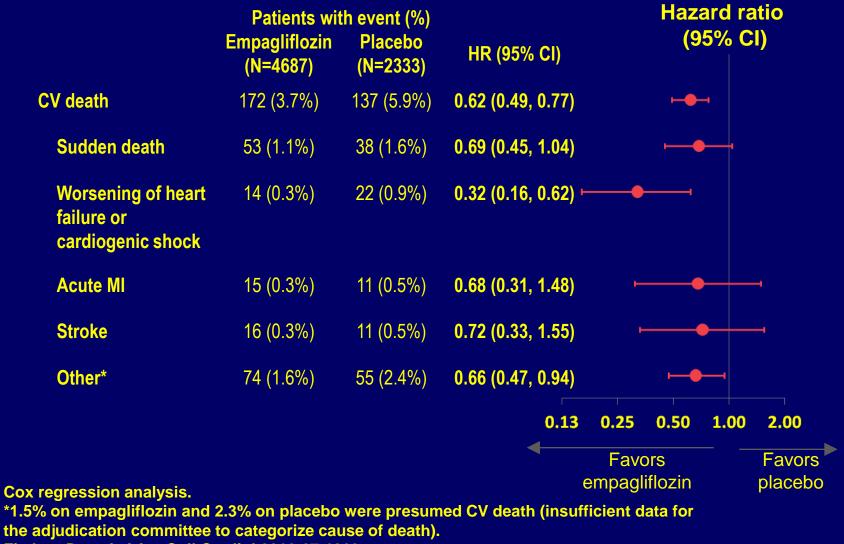

Zinman B, et al. N Engl J Med. 2015. 373(22):2117-28.

EMPA-REG (empagliflozin) Primary outcome: 3-point MACE

Canagliflozin for Primary and Secondary Prevention of Cardiovascular Events in Type 2 Diabetes: Results From the CANVAS Program

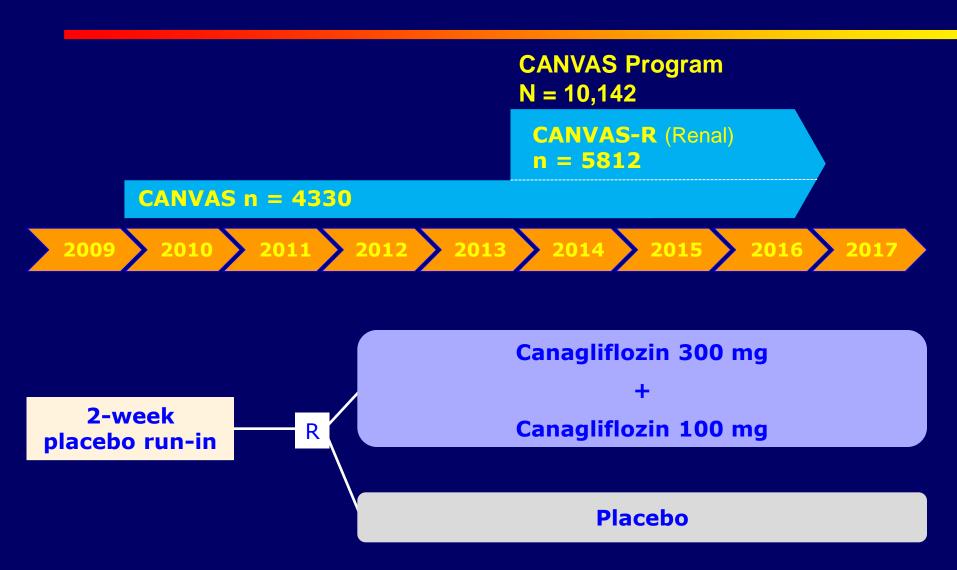

<u>Kenneth W. Mahaffey</u>, Bruce Neal, Vlado Perkovic, Dick de Zeeuw, Greg Fulcher, Ngozi Erondu, Wayne Shaw, Tao Sun, Mehul Desai, David R. Matthews, on behalf of the CANVAS Program collaborative group

November 13, 2017

CANVAS Program

DOI: 10.1161/CIRCULATIONAHA.117.032038

CANVAS Program

Neal B. NEJM. 2017.

CANVAS Participants

Patients with type 2 diabetes

- HbA1c ≥7.0% to ≤10.5%
- eGFR ≥30 mL/min/1.73 m²
- Secondary prevention: Age ≥30 years and history of prior CV event

OR

Primary prevention: Age ≥50 years with ≥2 CV risk factors*

Of 10,142 patients enrolled

- 6656 (66%) secondary prevention
- 3486 (34%) primary prevention

*Diabetes duration ≥10 years, SBP >140 mmHg on ≥1 medication, current smoker, micro- or macroalbuminuria, or HDL-C <39 mg/dL

Baseline Characteristics

	Secondary prevention (n = 6656)	Primary prevention (n = 3486)
Mean age, y	64	63
Female, %	31	45
Mean duration of diabetes, y	13	14
Mean HbA1c, %	8.2	8.3
Hypertension, %	89	91
Antihyperglycemic agents, %	98	99
Cardioprotective agents, %		
RAAS inhibitor	80	81

Diabetic Kidney Disease Shortens Life Span by 16 Years

Low Renal Risk Populations in Other CV Outcomes Trials

Timeline of Major SGLT2 Inhibitor Trials

CREDENCE began before any CV outcomes trials had reported

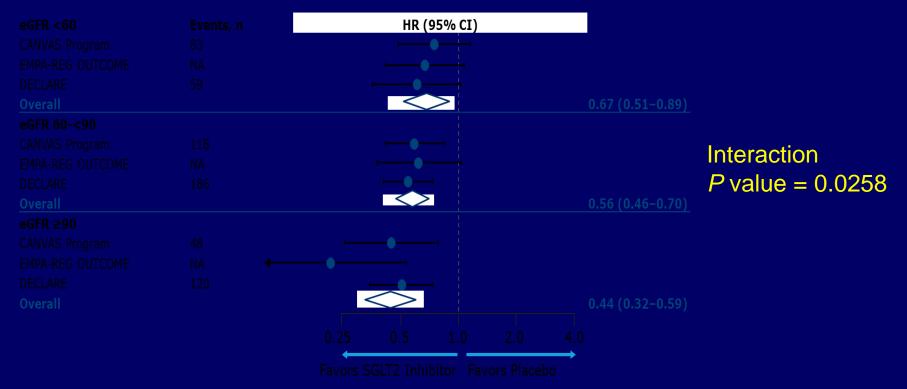

Renal effects were not the primary focus of the CV outcomes trials

Why Is CREDENCE Important?

CV outcomes trial results suggested possible attenuation of renal effects in patients with reduced kidney function

Composite of worsening of renal function, ESKD, or renal death

Primary Aim of the CREDENCE Trial

To assess the effects of the SGLT2 inhibitor, canagliflozin, on clinically important renal outcomes in people with T2DM and established CKD

Study Design

Key inclusion criteria

- \geq 30 years of age
- T2DM and HbA1c 6.5% to 12.0%
- eGFR 30 to 90 mL/min/1.73 m²
- UACR 300 to 5000 mg/g
- Stable max tolerated labelled dose of

ACEi or ARB for \geq 4 weeks

2-week placebo run-in

Doubleblind randomizati on (1:1)

R

Key exclusion criteria

- Other kidney diseases, dialysis, or kidney transplant
- Dual ACEi and ARB; direct renin inhibitor; MRA
- Serum K⁺ >5.5 mmol/L
- CV events within 12 weeks of screening

Canagliflozin 100 mg

Placebo

Follow-up at Weeks 3, 13, and 26 (F2F) then every 13 weeks (alternating phone/F2F)

Participants continued treatment if eGFR was <30 mL/min/1.73 m² until chronic dialysis was initiated or kidney transplant occurred.

Demographics and Disease History

Whether the increased risk of lower limb amputation in the CANVAS Program was due to differing trial populations or protocols, or to chance remains unclear

DECLARE – TIMI 58

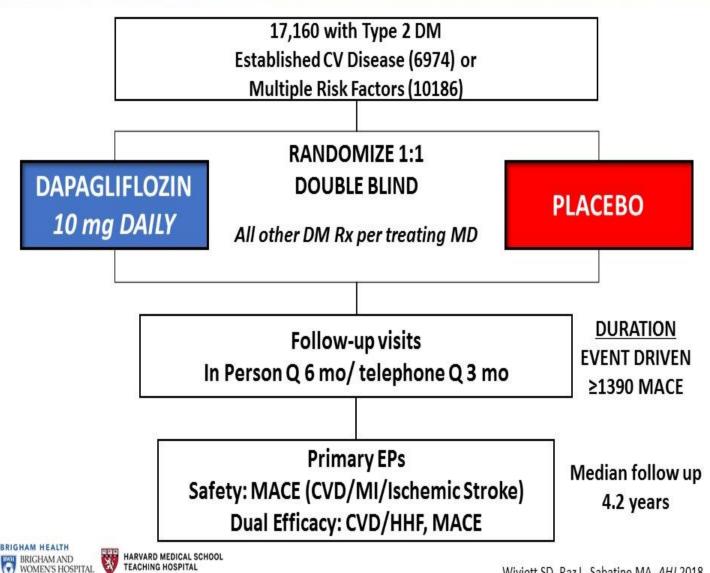

Stephen D. Wiviott, MD for the DECLARE – TIMI 58 Investigators American Heart Association, Scientific Sessions November 10, 2018

Wiviott SD, Raz I...Sabatine MA, AHJ 2018

Enrollment Criteria

Diagnosis of T2DM, HbA1c 6.5-12%, CrCl ≥60 ml/min

AND

Established ASCVD (Secondary prevention)

Ischemic heart disease Cerebrovascular disease Peripheral Artery Disease

Or

Multiple risk factors for ASCVD (Primary prevention)

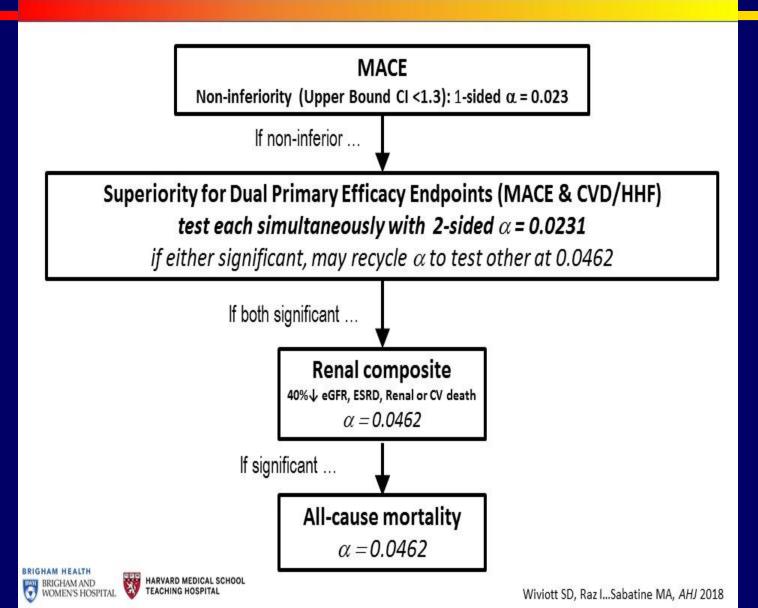

Men ≥ 55 yrs and women ≥ 60 yrs with at least one additional risk factor: Dyslipidemia Hypertension Current Tobacco use

BRIGHAM AND WOMEN'S HOSPITAL

BRIGHAM HEALTH BRIGHAM AND WOMEN'S HOSPITAL	djudicated		

Due to external events during the trial, both amputations and events of potential diabetic ketoacidosis were collected retro- and prospectively with specific case record forms introduced during the study to collect additional relevant information. Study sites were asked to review all subjects for events occurring prior to initiation of the collection forms and report those events.

In DECLARE – TIMI 58, the largest SGLT2i trial, which included a broad representation of 1° and 2° prevention patients:

- Dapagliflozin reduced CVD/HHF, was safe with regard to MACE and appeared to reduce renal events
 - \downarrow CVD/HHF was consistent regardless of baseline ASCVD or HF
- Dapagliflozin was safe and generally well-tolerated
 - ↑ Genital infections & DKA
 - No difference in: amputation, fracture, or stroke
 - ↓ Hypoglycemia, AKI, bladder Ca

BRIGHAM HEALTH BRIGHAM AND WOMEN'S HOSPITAL

Zelniker TA, Wiviott SD...Sabatine MA, Lancet 2018

SGLT2 Pros

- Inhibit renal reabsorption of glucose leading to:
- Osmotic diuresis
- NO increase in heart rate
- HgbA1c reduction similar to other oral agents
- No intrinsic hypoglycemia (unless used with hypoglycemic agent/s)
- Approx 5# weight loss
- 3-5 mmHg SBP drop: consider reducing diuretics/BP meds
- Reduced 3 point MACE in most (powered) studies
- Reduced risk of Heart Failure: secondary and possibly primary prevention
- Reduced progression of Nephropathy: albuminuria and GFR decline

SGLT2 Cons

- "Normoglycemic DKA"
- Increase in UTI and Fournier's Gangrene (perineum)
- May worsen orthostasis
- Slight increase in LDL-C
- Increased risk LE amputations in CANVAS trial (had preexisting dz)
- Not approved for GFR <45 ml/min (60)
- Increased fracture risk in some trials
- Increased bladder cancer risk in some trials
- Cost (in Medicare Patients)
- Caviats:
- discuss above with patients prior to Rx
- document absence of PAD prior to use
- Not approved for Type 1 DM (yet)
- Canagliflozin raises Digoxin levels use alternative

Freedom to Choose

Caviats:

- Use antihyperglycemics instead of hypoglycemics
- Consider non-glycemic benefits
